

## STIC Search Report Biotech-Chem Library

### STIC Database Tracking Number 1228

TO: David Lukton

Location: REM-3B\75/3C70

Art Unit: 1653

Tuesday, May 25, 2004

Case Serial Number: 09/977349

From: Toby Port

**Location: Biotech-Chem Library** 

Remsen 1A59

Phone: 571-272-2523

#### Search Notes

Dear Examiner Lukton,

Here are the results of your search.

Please feel free to contact me if you have any questions.

**Toby Port** 

# STIC SEARCH RESULTS FEEDBACK FORM

### Biotech-Chem Library

Questions about the scope or the results of the search? Contact the searcher or contact:

Mary Hale, Information Branch Supervisor 571-272-2507 Remsen E01 D86

Voluntary Results Feedback Feldin
> I am an examiner in Workgroup: Example: 1610
Relevant prior art found, search results used as follows:
102 rejection
☐ 103 rejection
Cited as being of interest.
Helped examiner better understand the invention.
Helped examiner better understand the state of the art in their technology.
Types of relevant prior art found:  ☐ Foreign Patent(s)  ☐ Non-Patent Literature  (journal articles, conference proceedings, new product announcements etc.)
> Relevant prior art not found:
Results verified the lack of relevant prior art (helped determine patentability)
Results were not useful in determining patentability or understanding the invention.
Comments:

Drop off or send completed forms to STIC/Biotech-Chem Library Remsen Bldg.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a specifically claimed peptide of the formula: V - (AAJ)n-Cys(V') - (AA2)m-V' (I), in which n and m = 0-5, totalling 2-5; if n = 1, AAI = AIa, if n = 2, (AAI)n = aIn-AIa, X = any amino acid; p = 1-3, depending on value of n; if m = 1, AA2 = Arg; if m = 2, (AA2)n = Arg-Gly; if m = 3 or more, (AA2)n = Arg-Gly-(X)q q = 1-3, depending on value of m; if m = 3 or more, (AA2)n = Arg-Gly-(X)q; q = 1-3, depending on value of m; v, v' and v'', any or all of which may be absent, = agent able to direct the compound to a specific cell. The peptides are inhibitors of cysteine proteases, specifically interleukin-1 beta converting enzyme (ICE) They inhibit death of cells, particularly in humans, and can be used to treat neurodegenerative diseases (e.g. ageing, Alzheimer's, Machado-Joseph, Parkinson's or Huntington's diseases multiple sclerosis, muscular dystrophy, stroke), cardiovascular disease and liver disorders. The peptides should be more specific than pseudosubstrate inhibitors

New peptides are provided which are 16 amino acids long and which are analogues of the peptide corresponding to residues 43-58 of the Attenmapedia transcription factor homeodomain (AntpHD). The peptides contain 6-10 hydrophobic amino acids. They have the general formula: X1-X2-X3-X4-X5-Trp-X7-X8-X9-X10-X11-X12-X13-X14-X15-X16 or X16-X15-X14-X13-X12-X11-X10-X9-X8-X7-Trp-X5-X4-X3-X2-X1 in which X1-X5 and X7-X16 are any alpha-amino acids, provided that: (1) the peptide contains 6-10 hydrophobic amino acids; (2) X3 and X5 are not both Val; and (3) the natural Antp 43-58 sequence RQIXINFONRANGWEK (i.e. the present sequence) is excluded. Specific examples of these peptides are given in AAW33408 - AAW33416. The peptides are used as vectors for introducing into live cells compounds which affect cell function, esp. peptides and nucleic cells comparements. They are as effective as helix 3 of a homeodomain peptide. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide(s) of high hydrophobic amino acid content - useful as vectors for delivering peptides and nucleic acids to cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention describes a composition comprising an isolated oestrogen receptor activity inhibiting (anti-oestrogen) peptide. The peptides used in the composition comprise sequences of human oestrogen receptor (OR) surrounding Tyr537 and steroid receptor co-activator-1 (SCR-1). The peptide compositions, nucleic acids and vectors of the present invention can reduce OR activity in a cell, reduced OR polypeptide dimerisation in a cell and reduce the binding of SRC-1 polypeptide to an OR polypeptide dimer in a cell. They can be used for killing cancer cells and treating cancers, particularly breast cancer. The present sequence represents a specifically claimed anti-oestrogen peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunosuppressive activity; inhibition; nuclear translocation inhibitor; nuclear translocation; treatment; immune disorder; autoimmune disease; hypersensitivity; sepsis; prevention; septic shock; antiviral agent;
                                                                                                                                                                                                                          New anti-oestrogen peptide compositions - comprise sequences based on oestrogen receptor and steroid receptor co-activator-1 sequences, used for treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

peptides AAW56397-99 represent preferred signal sequences of the invention. They are used to construct the nuclear translocation inhibitor polypeptides of the invention. Nuclear translocation inhibitor polypeptides of the invention. Nuclear translocation inhibitor inhibitor polypeptides comparise a signal sequence peptide capable of delivering the polypeptide through the cytoplasmic membrane into a cell, and at least 2 nuclear localisation signals (NLSs). The polypeptides can be used to inhibit nuclear translocation of a cellular protein. In addition, since the nuclear translocation of certain cellular peptides is required for the nuclear translocation of certain cellular peptides in reference be used for the treatment of immune response, the polypeptide inhibitors are used for the treatment of immune disorders including autoimmune diseases. The polypeptides can also be used for treating physical symptoms manifested by responses to allergens which can initiate a state of hypersensitivity, for the treatment of sepsis and in the prevention of capture shock, antiviral agents, tumour growth suppressors, and for transcriptionally modulating the expression of cellular genes
                                                                      Nuclear translocation inhibitor polypeptides - comprising signal sequence for delivery through the cytoplasmic membrane and at least 2 nuclear localisation sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense oligonucleotide; inhibit; cell death; Nedd2; human Ich-1L gene;

                                                                                                                                              AAW71270 and AAW71315-16 represent antennapedia peptides which are used to, direct the antisense oligonucleotides (AAV54973-74) of the invention to a cell: The antisense oligonucleotides are used to inhibit cell death mediated by withdrawal of a trophic factor. AAV54973 inhibits the expression of a Ned2 rodent gene, while AAV54974 inhibits expression of a human Ich-1L gene. The oligonucleotides are used to inhibit neuronal cell death, especially for treatment of neuronal cell death caused by e.g. aging, amyotrophic lateral sclerosis, Alzheimer's disease, dachoadodentacorubral and pallidolyusial atrophy, Huntington's disease, MachoadoJoseph disease, senility, spinocerebellar ataxia type I, spinobulbar muscular atrophy, stroke or trauma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antennapedia peptide for directing antisense oligonucleotides to a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotide; inhibit; cell death; Nedd2; human Ich-IL gineuronal cell death; treatment; aging; amyotrophic lateral sclerosis; Alzheimer's disease; dentatorubral; pallidolyusial atrophy; Huntington's disease; Machoado-Joseph disease; multiple sclerosis; muscular dystrophy; Parkinson's disease; senility; spinocerebellar ataxia type I; spinobulbar muscular atrophy; stroke; trauma; antennapedia.

AAW71270 and AAW71315-16 represent antennapedia peptides which are used to, direct the antisense oligomucleotides (AAV54973-74) of the invention to a cell. The antisense oligomucleotides are used to inhibit cell death mediated by withdrawal of a trophic factor. AAV54973 inhibits the expression of a Nedd2 rodent gene, while AAV54974 inhibits expression of a human Ich-IL gene. The oligomocleotides are used to inhibit neuronal cell death, especially for treatment of neuronal cell death caused by e.g. adjug, amyotrophic lateral sclerosis, Alzheimer's disease, dentacorubral and pallidolyusial atrophy, Huntington's disease, Machoado-Joseph disease, multiple sclerosis, muscular dystrophy, Parkinson's disease, senility, spinocerebellar ataxia type 1, spinobulbar muscular atrophy, stroke or trauma
Anti-sense oligonucleotide(s) to cysteine aspartase genes - used to inhibit neurodegenerative disorder associated with e.g. ageing, Alzheimer's, Huntington's or Parkinson's disease.

La Thangue NB, Bandara LR;

Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing re-stenosis.

The present sequence represents antennapedia protein derived internalization sequence associated with cadherin modulating agents.

These agents are used for modulating cadherin-mediated functions. They can be used for disrupting interaction between alpha-catenin and beta-catenin in a cell, inhibiting cell adhesion, e.g. between epithelial cells, neural cells, tumour cells and lymphocytes, for treating a demyelinating neurological disease, e.g. multiple sclerosis, for reducing unwanted cellular adhesion in a mammal, for enhancing the delivery of a drug through the skin of a mammal, for treating cancer in a mammal, for inhibiting angiogenesis in a mammal, for inducing calivery to the central nervous system of a mammal, for inducing appotosis in a cadherin-expression cell, for modulating the immune system of a mammal, in particular they can be used for treating diabetes, rheumatoid mammal. In particular they can be used for treating diabetes, rheumatoid arthritic, allerigic responses, antibody-mediated graft rejection or for

stimulating learning and memory

New catenin modulating agents - comprising peptides having a sequence HAV or analogues or antibodies, used for modulating cadherin-mediated functions.

the Drosophila melanogaster antennapedia protein. Such membrane translocation sequences are useful in directing entry of a polypeptide into a cell. Polypeptides of the invention (see AAM30504-07) are derived from the DEF box region (see AAM30501) of transcription factor DP1. They act as antegonists of the heterodimerisation of a DP protein with an R2F protein, and can be used to induced apoptosis, specifically in tumour and This polypeptide comprises a membrane translocation sequence derived from

antennapedia protein that translocates across biological membranes. This sequence can be linked to the Rho binding region of the invention (AAYS2100) to cause translocation across eukaryotic cell membranes. The Rho binding region is present in many Rho binding proteins, such as ROCK-CT in ROCK-II and Kinectin and is also referred to as the ROCK/Kinectin homology domain. Rho-A is involved in many cellular processes including creases fibre formation, cell motility, cytokinesis and apoptosis. The Rho binding domain is used in the invention which relates to an assay for potential modulators of cell growth. The assay consists of a Skn7 pothypeptide, a beta2 polypeptide or a polypeptide consisting of a ROCK/kinectin homology domain, a Rho polypeptide which binds to the previous peptides caused by the test compound is measured. The method is the two peptides caused by the test compound is measured. The method is the bost's defence system, particularly antagonists, of the interaction of Rho with its binding partners, e.g. to render pathogens sensitive to the bobbish contain can be used to screen databases for other

                                                                                                                                                                                                                                                                                   à
```

```
This sequence represents a peptide used in the construct of the invention. The construct is a membrane-permeable construct for transport across a lipid membrane, which comprises: (a) a nucleic acid analogue capable of hybridising with an intracellular polynuclectide (PN); (b) a peptide, and (c) a labile bond linking the nucleic acid analogue and peptide. The membrane-permeable constructs can be used for delivery of oligonuclectides, nucleic acids and nucleic acid analogues into cells. They can be used for e.g. cancer therapy, signal transduction studies, identifying new intracellular drug targets or gene therapy. They can also be used for selectively inhibiting DNA transcription, RNA translation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New membrane-permeable constructs - comprise a peptide linked by a labile bond to a nucleic acid analogue capable of hybridising with an intracellular polynucleotide.
                                                                                                                                                                                                                                                        inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RNA or DNA expression, DNA replication, or an DNA or RNA regulatory function of preselected DNA or RNA sequences in a living cell

```
The invention features fusion proteins that contain a calpastatin peptide and a signal sequence capable of delivering the fusion protein into a chekaryotic cell. The fusion protein is used for the inhibition of calpain in a cell. The fusion protein as especifically used: (a) to prevent aggregation and degranulation of platelets (e.g. during storage); (b) to inhibit hypoxia-induced sickling of erythrocytes (during storage); (b) to acidlitating subsequent transfusion of autologous cells for treatment of sickle cell crises); and (c) to inhibit activation of human immune of efficiency virus provinus in infected cells (or similarly for other viruses regulated by NF-kappaB). Other disclosed uses are: to treat or prevent inflammation (e.g. arthritis or asthma), unwanted immune cesponses (e.g. transpapalar rejection), restenosis (associated with angioplasty), cancer, subarachnoid hemorrhage, vasospasm, muscular dystrophy, cataracts and traumatic birth injury; to prevent spread of platelets on surfaces (e.g. when applied to the surface of stents, catheters etc.); to reduce coronary thrombosis in by-pass surgery and angioplasty; to treat myocardial infarction, or to prevent progression of infarction (myocardial or cerebral). The fusion protein has a reversible inhibitory effect and enters cells easily. It allows platelets to be
                                                                                                                                         Fusion protein; calpastatin; calpain; platelet aggregation; arthritis; hypoxia; erythrocyte sickling; sickle cell; HIV provirus; NF-kappaB; inflammation; asthomy immune response; restenosis; myocardial infarction; cancer; calpastat; antennapedia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fusion protein of signal sequence and calpastatin.

This invention describes novel truncated and altered forms of Rad51 products encoded by rad51TR1-131 and rad51K-A134. The products of the invention have immunosuppressive, cytostatic, antiinflammatory and antiproliferative activity. Altered and mutant forms of Rad51 are useful for inhibiting cell proliferation and for promoting programmed cell death. Therapeutic agents, factors or compounds capable of disrupting the essential processes mediated by or associated with normal Rad51 or Rad52 are useful for treating diseases like autoimmune disorders, inflammation, cancer, graft rejection and other proliferative and hyperproliferative disorders. This sequence represents a fragment of the Drosophila antennapedia protein which is described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                      nt forms of mammalian Rad51 proteins and polypeptides that disrupt proliferation and promote programmed cell death, encoded by specific

```
delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the
The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a cell permeable peptide comprising at least the hydrophobic core of a signal peptide (or analogue) containing at least 1 additional positively charged mino acid (or analogue). The peptides are useful for the intracellular delivery of molecules, especially peptide nucleic acids to in vivo targets. The peptides are useful in commercial drug-delivery systems, in e.g. gene therapy, cancer therapy and anti-infectious agent therapy. The peptides facilitate biochemical and molecular biological research. The modified peptides facilitate intracellular delivery of any cell-impermeable substances and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New cell permeable signal peptides, useful for intracellular delivery of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Karposi syndrome, fibroblast growth factor, signal peptide, PNA, peptide nucleic acid, cell permeability, intracellular delivery;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                              of free beta-catenin in the cell, and methods of stimulating the expression of genes involved in callular differentiation, the transcription of which is under the control of beta-catenin. The peptides given in AAB27053-B27088, AAB27244-B27300 and AAB2730-B27351 can be used se modulating agents which interrupt the interaction between alpha and beta catenin, causing increased levels of the latter and stimulating the activation of beta-catenin mediated transcription. This can be used to stimulate cell differentiation, which can then be used to promote hair growth and skin exfoliation. This latter is particularly useful in the improvement of photodamaged skin and to minimise wrinkles. The modulating peptide can also be used to reduce hearing loss resulting from inner ear
                                                                                                                                                                                  Stimulating beta-catenin mediated gene expression, cellular differentiation and hair growth, involves contacting cells with modulating agent capable of inhibiting interaction between alpha and beta
                                                                                                                                                                                                                                                                                                                                         present invention is concerned with methods of modulating the amount
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anticancer agent; cancer cell; resistance; P-glycoprotein pump; cancer.

The specification describes a protein transduction system, which comprises a fusion protein. This fusion protein has a covalently linked protein transduction domain and cytotoxic domain. The system is useful for treating pathogen infection in mammals, infections such as those caused by CWV, HSV-1, HCV, KSHV, yellow fever virus, flavivirus or rhinovirus, retroviral infections such as HIV-1, HIV-2, HTVL-3 and/or LAV, plasmodial infections associated with P.faciparum, P.vivax, P.ovale, P.malariae. It

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides a composition comprising an isolated polypeptide (I) (polypeptide inhibitor of a cellular protein nuclear translocation) which comprises a signal sequence peptide capable of delivering (I) through a cytoplasmic membrane into the cell; and a nuclear localization signal sequence (NLS) present along with an immunosuppressant. (I) or its derivatives provide usefult tools for introducing an exceence polypeptide comprising an NLS into an intext cell to inhibit nuclear translocation of a cellular protein, for studying the role of nuclear translocation in the regulation of cellular processes. See AAY55812 for detailed uses of (I) and compositions contianing (I). The present sequence represents a signal sequence for delivering the (I) through the cytoplasmic membrane into the

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB phospholamban (PLB) deficiency and inhibits the interaction between PLB cargo peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB. Native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the transport peptide composed of residuces 43-58 of antermapedia (AMT), a drosophila transcription factor protein. This peptide can be used to transport therapeutic agents across a cell membrane into the cytoplasm and nucleus
Phospholamban, PLB; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiovycoyte; transport peptide; penetratin; cargo peptide; inhibitor; contractilin; cardiac contractility; cardiac disease; antennapedia; ANT; treatment; cardiant; heart failure; myocardial dysfunction; fruit fly.
                                                                                                                                                                                                                                                                                                                                                                                           Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 92; DB 3; Length 16; Pred. This invention describes a novel fluorogenic conjugate (vector) for fluorescence labeling of specific targets within cells which comprises a membrane translocation component, a targeting component and a membrane translocation component, a targeting component and a fluorophores form a donor-acceptor pair for fluorescence resonance energy fluorophores form a donor-acceptor pair for fluorescence resonance energy transfer (FRET), can be used to measure interactions between two substances, especially in living cells, when the targeting component of one of the other conjugate targets one of the substances and the targeting component of the other conjugate targets one of the substances and the targeting component of the other conjugate targets the other substance. The conjugate or kit can be used to detect a target in a biologically confuctional cell. When the conjugate has a fluorophore capable of acting as a donor or acceptor for FRET with a fluorescent protein, it can be used to measure intracellular levels of a fusion protein, it can be used to measure intracellular levels of a fusion protein of the cell celluorescent protein by FRET if the targeting component targets a sequence of the fusion protein by FRET if the targeting component targets a cell culture, the necessity preferably by means of a cell sorter or by FRET microscopy, especially where the fluorescent protein is green fluorescent protein (GFP) and the fluorophore is BODIPY, fluorescein, oregon green, rhodamine, Texas red, CY2, CY3, CY5, Alexa, Marina blue, pacific blue or AMCA. The cells are especially bacterial, yeast, insect, antenned mammalian cells. This sequence represents a fragment of the amenmalian cells. This sequence represents a fragment of the amenmalian protein protein which is used to illustrate the membralian cells. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                                                           Fluorogenic conjugate for intracellular fluorescence labeling, especially for performing fluorescence resonance energy transfer assays in living cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

the retinoblastoma protein. The products of the invention have antitumor, antiproliferative, antipsoriatic and antiatherosclerotic activity. The peptides are used to treat and/or diagnose diseases that involve increased proliferation or hyperproliferation of cells, specifically benign or malignant tumors (especially of the breast), atherosclerosis and psoriasis. (1) are more active against proliferation than similar compounds described in DE19653445, so doses and treatment times may be reduced, thus also reducing the cost. They destroy almost all types of tumor cells, especially those in which the retinoblastoma gene or protein is defective, but have relatively little effect on normal cells, which is in contrast to conventional chemotharapeutic agents. This sequence represents a peptide, AB which is used to describe the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating a cellular process by contacting a cell in culture with a cell process modifying molecule attached to a translocating polypeptide, useful for modulating expression of a target gene product.
activity which comprise a nuclear localization sequence and a fragment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a fragment of the Antennapedia protein (amino acids 43-58) from Drosophila. The fragment is used as a translocating protein in the course of the invention. The specification describes a method for modulating a cellular process and for delivery of functional protein sequences. The method comprises contacting a cell in culture under suitable conditions with a cell process modifying molecule attached to a translocating polypeptide, where molecule is translocated into the cell and interacts specifically with a responsive target site. The method is useful for modulating a cellular process, such as modulating expression of a target gene product, of a cell in culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antennapedia protein; translocating protein; cellular process;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antiproliferative, nuclear localization sequence, retinoblastoma protein; antitumor; antipsoriatic; antiatherosclerotic; treatment; diagnosis; benign tumor; malignant tumor; breast; atherosclerosis; psoriasis;
                                                                                                                                                                                                                                                                                                                                                                                                                              bifunctional protein with nuclear transport and cell adhesion activities. The phage is used as a vector for transport of foreign genes into a cell nucleus for gene therapy. This sequence represents a peptide fragment which is used in the method of the invention
                                                                                                                                                                                                                                                                                           Phage for gene therapy carrying in its head part a bifunctional nuclear transport/cell adhesion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel peptides (I) with high antiproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide with high antiproliferative activity, useful for treating cancer or psoriasis, comprises a nuclear localization sequence and a fragment of the retinoblastoma protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                       Nakanishi
                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel phage whose head part contains a

The invention relates to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous system. The linear peptide preferably has the formula: (a) X1-X16 are system. The linear peptide preferably has the formula: (b) X1-X16 are mino acids (aa), of which 6-IO of them are hydrophobic and X6 must be Try; each B is as containing a side chain that includes a basic group; and each X is an aliphatic or aromatic as. The linear peptide may be retro forms of (a)-(c) containing D- and/or L-form as, or a fragment containing at least 5, preferably at least 7 consecutive as from (a)-(c). Peptides able to cross the BBB include protegrins, Antennapedia, ceffects and are termed peptide antibiotics. They fall into 3 main categories based on their structure: (i) peptides with alpha-helices, ceffects and are termed peptide antibiotics. They fall into 3 main categories based on their structure: (i) peptides with dishiphide bond-linked beta-sheets, e.g. protegrin, tachyplesins, (ii) peptides with companies of the invention fall into the peptide antibiotic categories defined above: (a)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on trotegrins; and (c)-peptides are based on tachyplesins.     the BBB and is conjugated to a doxorubicin molecule by a succinimydyl maleinido-propionate-3-mercaptopropionate linker. Conjugates of the linear peptides and the active agent are particularly used to treat, prevent or diagnose brain cancer, Alzheimer's or Parkinson's diseases, depression, pain and meningitis, but also for studying drug behaviour in BBB models
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptide comprising a sequence LXXLL or peptide analogue of LXXLL. The method is useful for modulating beta-catenin mediated gene transcription, cell differentiation, hair growth, and retinoic acid activity, for treating cancer, and for inhibiting the development of Alzheimer's
represents a synthetic linear peptide designed on peptides able to cross
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of modulating agent comprising internalization moiety and a peptide, for modulating beta-catenin mediated gene transcription and cell differentiation, for treating cancer, and for inhibiting Alzheimer's

Dev. Dyn. 194:21-32(1992)
-!- FUNCTION: Sequence-specific transcription factor which is part of
a developmental regulatory system that provides cells with
specific positional identities on the anterior-posterior axis.
-!- SUBCELLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Gene 114:179-186(1992).

-!- FUNCTION: Sequence-specific transcription factor which is part of
a developmental regulatory system that provides cells with
specific positional identities on the anterior-posterior axis.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SUBCELLULAR: Delongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-JUL-1993 (Rel. 26, Created)

-I. SUBCELULIAR LOCATION: Nuclear.
-I. TISSUE SPECIFICITY: Predominantly spinal cord and kidney.
-I. SIMILARITY: Belongs to the Autp homeobox family. Deformed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Development 105:639-650(1989).

-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                          Bukaryoča; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

I. FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.

I. SUBCELLULAR LOCATION: Nuclear.

I. DEVELOPMENTAL STAGE: EXPRESSED EXCLUSIVELY IN BARLY EMBRYOS.

I. SIMILARITY: Belongs to the Autp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic Acids Res. 16:10364-10364(1988).

-!- SUBCELULIAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Predominantly spinal cord and kidney.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rattus norvegicus (Rat).

--- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
--- SUBCELLULAR LOCATION: Nuclear.
--- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heterodontus francisci (Horn shark).
